

Method of forming a downhole charge of explosives includes placing in the well cavity, along the periphery of its wall, opposite to each other, upper and lower detonators with means of initiation, introducing explosives into the well cavity and performing hammering with subsequent initiation of the upper and lower detonators. Whereas cumulative charges are formed between the downhole explosive charge and the borehole wall along their periphery, with the possibility of creating and directing their cumulative jets towards each other, using V-shaped cumulative recesses, which, before introducing explosives into the borehole cavity, are placed under the upper and above the lower detonators with their tops facing the mentioned detonators.
